

# V-MIGRATE

*Migration Intelligence, Automatically*

## MOVE YOUR LEGACY WINDOWS SERVER APPLICATIONS TO A BETTER FUTURE

There's no question that modern is a desirable destination. Modern lets you leverage features and functionality of a new operating system on a new server or on the cloud of your choice. It lets you avoid costly custom and extended support fees for Windows Server, consolidate a data center, and address security risks and noncompliance associated with running on unsupported operating systems.

There's also no question that manually re-installing applications, redeveloping software, and upgrading or rebuilding machines take lots of time and budget. V-Migrate lets you get to your migration destination in a fraction of the time, cost, and effort—even if you're missing original install media or scripts.

V-Migrate lets you automatically move Windows Server applications to a new platform; for example, from Windows 2000, Windows Server 2003 or 2008 to Windows Server 2012, 2016, or 2019. If you're moving to Windows Server 2016, you can get there in one step—no need to first upgrade to Windows Server 2012.

Migrate only the apps you need with minimal change windows, using containerization technology that offers portability and agility, and eliminates cloud lock-in.
