

V-MONITOR

A Key Player in the VirtaMove Migration Intelligence Suite

BUILD A SMART MIGRATION PLAN

You're about to start a Windows Server modernization project. Your organization might have hundreds or even thousands of servers. How do you know which applications are on which server, which are used and which are in fact defunct? Can you confidently say which apps are business critical and exactly how and when they're used?

Start your migration project with an automated monitoring of applications on your servers so that you can understand your migration options. There's no need to waste time and resource on migrating a useless application. Instead, focus on business-critical apps that are ideal targets for automated VirtaMove migration, to achieve both savings and momentum in your modernization efforts.

V-Monitor puts intelligence up front in your project, letting you:

- Detect which applications are running on which Windows server
- Determine which applications should be decommissioned and which should be your priority
- Discover app dependencies so that migration & testing go without a hitch
- Size migration tasks and plan capacity for new in house or cloud servers

Let V-Monitor run for a couple of days and be rewarded with insights you can use. How you run it is up to you: you can start, for example, by monitoring only Windows Server 2008 servers for migration planning purposes. Over time, build up to monitoring all the Windows servers in your environment, which will provide information for future migration efforts for Windows Server 2012 based application migration.
