

# Defer Costs Associated with Redeveloping Applications

Migrate First for Immediate Gains, Redevelop Later

## The Challenge: Moving Forward without Redeveloping Now

Your organization might be poised to embrace new technologies to respond to modern digital challenges. But your legacy systems and business-critical application are holding you back. Your outdated operating system is incompatible with the cloud and your application architecture isn't cloud-friendly. Your legacy servers may also be in violation of compliance regulations and need to be retired ahead of an upcoming audit. It may seem like your only option is a big redevelopment project: reworking your application from the ground up.

Maybe your IT operations lack the specialized skills and sufficient budget to carry off a big rework project. Perhaps your organization doesn't want the business disruption and risk. These realities shouldn't hold your organization from moving forward.

## The Solution: VirtaMove Application Migration

If you're planning to modernize and redevelop aging applications in the near to mid-term, you need to understand them to rebuild functionality. The first step is baselining: understanding the architecture, performance, usage, dependencies and features of the old application.

VirtaMove's intelligent application discovery and monitoring capabilities provide transparency into dependencies, resource usage, use patterns, and capacity needed to run applications in modern environments. Reporting data provides valuable information on requirements for scoping your future redevelopment project.

Get immediate benefits from moving your legacy application to new hardware, modern operating systems, and new destinations. Enjoy enhanced performance and security, in the cloud or on premise, for a modest investment and with a seamless changeover. Plan now for redevelopment later.

## Why VirtaMove?

VirtaMove's patented software captures applications in Virtual Machine-free and operating system-free moving containers. This means that **VirtaMove** technology can move even the most complex server applications to modern, supported operating systems in any environment and any cloud. Containers preserve application state and provide portability and flexibility, which mean agility and no cloud lock in. We've moved thousands of applications for hundreds of customers in all sectors and industries.

- ⚡ Defer redevelopment while reaping immediate security and performance benefits.
- 📊 Baseline your legacy application and scope requirements for successful redevelopment
- 🕒 Buy time to properly plan for redevelopment
