

# Plan for Optimized, Targeted Application Migrations

Eliminate Guesswork and Assumptions from Your Migration Projects

## The Challenge: Achieving Informed and Targeted Migrations

As companies respond to modern challenges, such as technological advances and security concerns, planning for the future requires full visibility of a company's IT assets. More monitoring, however, doesn't always mean better monitoring. Migrating servers and business-critical applications to new environments without a clear picture of the existing environment and understanding of a network can result in increased costs and low yield on an organization's modernization investments.

## The Solution: VirtaMove Intelligent Application Discovery and Monitoring

A smart move starts with a great plan. Get deep insights into your legacy systems so you can make informed, strategic migration decisions. Our migration assessment tools provide a clear picture of migration candidates and priorities, server profiles, resources, dependencies and provide total estimated annual costs for cloud migrations. Remove assumptions and guesswork from migration plans, and eliminate unexpected migration costs.

Avoid migrating unnecessary applications, eliminate technical pitfalls before, during, and after a migration, and remove best guesses in capacity planning so you don't over or under provision destination servers. Smart data means you don't have to jump into application migration with a blindfold on. Achieve effective and optimized migrations, faster and more cost effectively than you would have thought possible.

VirtaMove's next-generation cloud migration solution lets you retire that unsupported operating system and reap performance and security benefits in the destination of your choice. Don't let legacy systems hold your company back.

## Why VirtaMove?

VirtaMove's patented software captures applications in Virtual Machine-free and operating system-free moving containers. This means that **VirtaMove** technology can move even the most complex server applications to modern, supported operating systems in any environment and any cloud. Containers preserve application state and provide portability and flexibility, which mean agility and no cloud lock in. We've moved thousands of applications for hundreds of customers in all sectors and industries.

-  Get full visibility of your IT assets and deep insights on IT assets.
-  Plan smart migrations and achieve optimized, effective moves
-  Reduce migration costs and time to migrate per server
-  Retire legacy servers and systems.
